

Preventive Care for Periodontal Disease (PD) in Dogs

More than 80% of dogs over the age of 2 years have some degree of PD. Preventive care and treatment aims to slow the progression of the disease.

COMMON PREVENTIVE CARE OPTIONS

Outlined below are examples of types of preventive care that caretakers can use between dental cleanings at the veterinary clinic.

BRUSHING

PROS

- The “gold standard”
- Most effective method
- Inexpensive

CONS

- Requires training of the dog to accept it
- Time-consuming—may not be practical with a large number of dogs

PRACTICAL TIP

For best results, combine two or more types of preventive care.

Remember:

PREVENTIVE CARE aims to slow the development of PD by removing the plaque and tartar from the teeth **BUT** does not replace the need for regular veterinary exams and professional veterinary dental cleanings under anesthesia.

CHEW ITEMS

PROS

- Effective when used consistently, such as daily
- Provides enrichment to the dog

CONS

- Risk of broken teeth
- Risk of gastrointestinal obstruction
- Some products are expensive

DENTAL DIETS

PROS

- The abrasives in the kibble work to clean the teeth
- Size and hardness increase chewing
- Effective when fed as main diet

CONS

- May be too hard or large for toy breeds
- Not nutritionally complete for pregnant or lactating dogs

RINSE or GELS (containing chlorhexidine)

PROS

- Effective when used consistently, such as daily

CONS

- Must apply directly to the gums
- Tastes bad
- Hasn't been shown to be effective when added to water
- May not be safe during pregnancy

DID YOU KNOW?

Anesthesia-Free Dentistry (i.e., hand-scaling, scraping tartar off teeth) does **NOT** slow or prevent PD. In fact, it may increase the risk and severity of PD:

- Removes tooth enamel, leaving a rough surface for bacteria to grow and tartar to build up quickly
- Does not allow for cleaning under the gum line
- Very likely to be **painful** and **stressful** to the dog
- Increases the risk of bites or injuries to the caretaker

We encourage dog owners to consult with their veterinarian to develop the best plan for their dogs.
